Construction Site Safety: Emergency and Fire Safety

Training document for the SafeSite Assistant RAG exercise

Important note: This is fictional training material prepared for software testing and learning. It is not official regulatory guidance. Verify legal requirements against the applicable jurisdiction and competent safety advice.

1. Purpose and scope

This sample describes general emergency arrangements for construction sites. The site's emergency plan, local emergency services, and applicable fire and safety regulations take precedence.

2. Raising the alarm

If a fire or serious emergency is discovered, raise the alarm using the site's established method and contact emergency services according to the emergency plan. Give the location, type of emergency, and known hazards.

Do not put yourself or others at additional risk to investigate or fight a fire. Only trained personnel should attempt to use firefighting equipment, and only when it is safe to do so with a clear escape route.

3. Evacuation

Stop work safely when possible, leave by the designated escape route, and proceed to the assembly point. Do not use lifts or equipment that the emergency plan prohibits during evacuation.

Do not re-enter the affected area until an authorized person or emergency responder confirms it is safe. Report missing persons or people needing assistance to the designated coordinator.

4. Keeping routes and equipment ready

Keep exits, access roads, fire points, alarm devices, and escape routes clear and identifiable. Report blocked routes, damaged alarms, missing signs, or inaccessible firefighting equipment.

Store flammable materials in designated locations and follow site controls for hot work, fuel storage, charging areas, and waste. Keep ignition sources away from areas where flammable vapours or dust may be present.

5. Drills and communication

Workers should receive information about alarm signals, escape routes, assembly points, emergency contacts, and their assigned responsibilities. Conduct drills as required by the site plan and applicable rules.

After a drill or emergency, review what worked, record issues, and assign corrective actions. Update emergency information when site layout, hazards, or personnel change.

6. Questions this document can answer

What should a worker do after discovering a fire? Raise the alarm, follow the emergency plan, evacuate if required, and contact emergency services as instructed.

When may workers re-enter an evacuated area? Only after an authorized person or emergency responder confirms it is safe.

Should an untrained worker fight a fire? No. Do not take risks; follow the emergency plan.

End of document.
